About This Guide

This section provides information about the Simple Order API guide for Barclays.

Audience and Purpose

This guide is written for application developers who want to use the Cybersource Simple Order API to integrate credit card processing with Level II or Level III data into their order management system.

Implementing the Cybersource credit card services requires software development skills. You must write code that uses the API request and reply fields to integrate the credit card services with Level II or Level III data into your existing order management system.

Conventions

The following special statements are used in this document:

Important: An *Important* statement contains information essential to successfully completing a task or learning a concept.

Introduction to Level II and Level III Processing

For business to business customers, Level II and Level III processing can provide lower interchange rates in exchange for providing more information during a transaction.

Level II processing includes additional customer and tax information for the transaction. Level III processing includes line-item data for each transaction. Barclays does not support Level II processing only. You must include at least one line-item to process Level II transactions with Barclays. See [Supported Processors and Card Types: Level III \(on page 7\)](#) for lists of the supported card types for your processor.

Important: Barclays does not support discounting.

This document provides guidelines that indicate which fields are required to obtain the best interchange rates. These guidelines are based on industry information available at the time of publication. Cybersource recommends that you contact your acquirer for the most current information requirements, as these requirements can change at any time.

Level II Data

Level II cards, which are also called *Type II cards*, provide customers with additional information on their credit card statements about their purchases. Level II cards enable customers to easily track the amount of sales tax they pay and to reconcile transactions with a unique customer code. There are two categories of Level II cards:

- Business/corporate cards are given by businesses to employees for business-related expenses such as travel and entertainment or for corporate supplies and services.
- Purchase/procurement cards are used by businesses for expenses such as supplies and services. These cards are often used as replacements for purchase orders.

Each processor supports a different set of Level II fields. If your business is not in the United States, you must use additional fields.

Support for Level II processing is processor and card specific. See [Supported Processors and Card Types: Level II \(on page 7\)](#) for a list of the supported card types for your processor. .

Barclays does not support Level II processing only. You must include at least one Level III line-item to process Level II transactions with Barclays.

Supported Processors and Card Types: Level II

Barclays supports the following card types to process Level III transactions.

To process transactions with Level II data on Barclays, you must include at least one Level III line-item field in the request.

Processor	Level II Card Types Supported
Barclays	<ul style="list-style-type: none">• Mastercard• Visa

Level III Data

You can provide Level III data for purchase/procurement cards, which are used by businesses for expenses such as supplies and services. These cards are often used as replacements for purchase orders. The Level III data is forwarded to the company that made the purchase. It enables the company to manage its purchasing activities.

Check with your processor to determine whether you need to add Level III processing to your contract or account setup. Support for Level III processing is processor and card specific. See [Supported Processors and Card Types: Level III \(on page 7\)](#) for a list of the supported card types for your processor.

When you are ready to go live with Level III processing, contact Customer Support to have your account configured to process Level III data. If your account is not enabled and you try to send Level III transactions, you will receive an error for invalid data.

Important: Unless otherwise specified, Level III transactions must include Level II data.

Supported Processors and Card Types: Level III

Barclays supports the following card types to process Level III transactions.

Important: Barclays only supports Level III transactions on commercial cards. Transactions made with non-commercial cards and including Level III data will be rejected by Barclays. Cybersource recommends that you use BIN checking prior to authorization to ensure that only commercial cards are accepted. Cybersource does not perform a BIN check to verify that the card is a commercial card.

Level III Transaction Details

Barclays

To qualify for Level III interchange rates, you must include at least one item in your request. The maximum number of items you can include in a request is credit card specific:

- Mastercard: 99 items
- Visa: 99 items

Cybersource Level II and Level III Data Processing

Cybersource does not store Level II and Level III data. Rather, it functions as a pass-through service for the data. Thus, if you request multiple partial captures or credits for an order, you must include the Level II and Level III data in each request.

During data processing, validation is performed in order to minimize interference with business policies between the merchant and customers. The following validation calculations are performed for each line item for invoice data:

- **orderInformation.lineItems[].totalAmount** must equal **orderInformation.lineItems[].unitPrice** multiplied by **orderInformation.lineItems[].quantity**
- **orderInformation.lineItems[].taxAmount** must equal **orderInformation.lineItems[].taxRate** multiplied by **orderInformation.lineItems[].unitPrice** multiplied by **orderInformation.lineItems[].quantity**.

The following validation calculations are performed for transaction totals for invoice data:

- **orderInformation.amountDetails.totalAmount** must equal the sum of **orderInformation.lineItems[].totalAmount** and **orderInformation.lineItems[].taxAmount**
- **orderInformation.amountDetails.taxAmount** must equal the sum of **orderInformation.lineItems[].taxAmount**

If Level III transactions produce batching errors while data is transmitted to the processor, the Level III processing field is disabled (value set to **N**) and the merchant is sent a message showing the change in status. When this happens, the request is not rejected, and the disabled processing field is included in the status message.

- For captures, the disabled field is **ccCaptureReply_purchasingLevel3Enabled**
- For credits, the disabled field is **ccCreditReply_purchasingLevel3Enabled**

For example, when a capture transaction produces batching errors, the **ccCaptureReply_purchasingLevel3Enabled** field is set to **N**.

Cybersource recommends that you include the total order amount in the authorization request, when authorizing Level III transactions. Doing so ensures that your total order amount is used and that the capture or credit request total amount matches the original authorization total amount.

Important: If you omit required Level II and Level III fields from a request, the transaction does not fail. It is processed successfully. This could result in higher fees or penalties assessed against your account. Contact your processor to ensure that you understand your processor's specific requirements for Level II and Level III transactions.

Relaxed Requirements for Address Data and Expiration Date

To enable relaxed requirements for address data and expiration dates, contact customer support. For details about relaxed requirements, see [Relaxed Requirements for Address Data and Expiration Dates](#).

Using Decimals and Strings

Cybersource uses decimal points in all amount and tax rate fields; Cybersource does not use implied decimal points. For example, if the amount of the product being purchased is 29.95, set that field to `29.95`.

Barclays does not support fractional quantities. You must use whole numbers only. For tax rates used with Level III transactions, you must include a decimal point in the value. For example, if a tax rate is 1%, you should set that field to `1.00`.

For many of the fields described in this document, Visa and Mastercard permit different lengths for alphanumeric (string) input. Cybersource accepts any length you provide. If the value you provide is longer than the payment card company permits, Cybersource truncates the value, keeping the left-most portion of the value. If the value you provide is shorter than the payment card company requires, Cybersource pads the field before sending it to the processor.

Numbered-Elements

The Cybersource XML schema includes several numbered elements. You can include these complex elements more than once in a request. For example, when a customer order includes more than one item, you must include multiple `<item>` elements in your request. Each item is numbered, starting with `0`. The XML schema uses an `id` attribute in the item's opening tag to indicate the number. For example:

```
<item id="0">
```

As a name-value pair field name, this tag is represented as an `item_0`. In this portion of the field name, the underscore before the number does not indicate hierarchy in the XML schema. The item fields are generically referred to as `item_#_<element-name>` in the documentation.

Below is an example of the numbered `<item>` element and the corresponding name-value pair field names. If you are using the Simple Object Access Protocol (SOAP), the client contains a corresponding `Item` class.
